

HTML Guide: Text Block Elements

Element	Code	Note
Paragraph	<code><p></p></code>	Creates a body copy paragraph. Browsers automatically add some space (margin) before and after each <code><p></code> element.
Headings	<code><h1>Largest and Most Important Head</h1></code> <code><h2></h2></code> <code><h3></h3></code> <code><h4></h4></code> <code><h5></h5></code> <code><h6>Smallest and Least Important Head</h6></code>	These elements define heading text blocks. Headings should follow the HTML semantic rules by being assigned to heads based on a head's level of importance. The most important head is the <code><h1></code> element.
Blockquote element	<code><blockquote></blockquote></code>	Browsers usually indent text left and right. Don't use for indentation. Use to specify quoted material or reference. Can optionally contain one or more <code><p></code> elements
Cite attribute	<code><blockquote cite="URL"></code>	URL is the web addresses of your source document
Address element	<code><address></address></code>	Defines the contact information for the author/owner of the website or of an article
