Positioning

Styling	Property	Values	Comments
Positioning Controls	position	absolute	The Absolute value positions an item at a specific coordinate point relative to its nearest non-static ancestor element.
		relative	Relatively positioned elements will initially be placed according to normal document flow. If an item is assigned a relative position, its child items can be positioned within it via the Absolute value.
		static	The Static value is similar to the Relative value except that the Static value cannot explicitly position an element. BTW, all elements default to Static.
		fixed	Fixed elements do not scroll and are positioned relative to the viewport.
		sticky	Sticky positioned elements toggle between relative and fixed positions.
Y Coordinate	top	Lengths	Positions item by its top edge
	bottom	Percentage	Positions item by its bottom edge
X Coordinate	left	Auto	Positions item by its left edge
	right	Inherit	Positions item by its right edge
Layers	z-index	number	Higher the number the higher the item is in the stacking order. Before you can set an item's stacking order you must have the **Position** property defined with a value other than **static**.
